Java Networking Online (Section C)

There will be a single server and multiple clients. Any client will have the following five menu options (command-line based):

1. Enroll
2. Login
3. GetList
4. SendOne
5. Multicast

Enroll
The client will send a name and a password to the server. The server will store the client's information.

Login
The client will send the name and password to the server. The server will authenticate it and, upon success, will add the client to the list of connected clients.

GetList
The client will request the server to send the list of names of all the connected clients. The server will send the list.

SendOne
The client will choose one from the list and request the server to send a message to that specific client. That specific client will display the received message.

Multicast
The client will request the server to send a message to a list of selected clients except itself. The client will also send the same message to the server. Then, all the selected clients and the server will display the received message.

You have to design all the different types of messages between the server and the clients. You have to create new classes if required for proper encapsulation. You can use the provided codes in the theory class.
